This Tableau story analyzes Airbnb listings in New York City to uncover patterns in pricing, availability, reviews, and location. Using two datasets, it explores how listings are distributed across neighborhoods, which hosts charge the most, and how factors like room type and review frequency affect performance. The first dashboard shows that Manhattan and Brooklyn have the highest number of listings and prices. The second highlights the most expensive hosts, revealing that corporate hosts dominate the luxury market. The third examines how availability and reviews relate to listing success. Overall, the story shows clear relationships between location, host strategy, and listing outcomes.

This analysis of Airbnb listings in New York City reveals several important trends and insights based on location, pricing, room types, and host activity.

The first key insight is that Manhattan and Brooklyn are the most active boroughs in terms of Airbnb listings. They not only have the highest number of listings but also command the highest prices, indicating their popularity among both hosts and guests. The Total View dashboard illustrates this clearly through a geographical distribution map and a borough-wise listing count.

Host Places

Neighbourhood

(All)

Total Price

\$57 \$563,707

The first dashboard, titled "Total View," presents an overview of Airbnb listings across New York City. It features a map where each listing is represented by a circle, with the size of the circle corresponding to the total price, allowing users to quickly identify high-priced areas. Alongside the map, a bar chart shows the number of listings per borough, with Manhattan and Brooklyn clearly standing out as the areas with the highest concentration of listings. Users can interact with filters for neighborhood and room type, and the color scale at the bottom displays the range of median prices to give an idea of affordability.

Secondly, the Most Expensive! dashboard uncovers that many of the highest-priced listings are managed by hosts from Brooklyn and Manhattan, such as Sonder (NYC) and Blueground. These hosts typically offer entire apartments and operate at scale, which allows them to dominate the high-end segment of the market. The room type distribution further shows that entire homes/apartments are the most common and are generally more expensive than private or shared rooms.

The second dashboard, titled "Most Expensive!," focuses on identifying the highest-priced hosts in the dataset. A bar chart ranks hosts by their total listing price, revealing that corporate or professional hosts such as Sonder (NYC) and Blueground dominate the high-end market. Below this, another chart shows the number of listings by room type, indicating that entire home or apartment listings are the most common and typically associated with higher prices. The visualizations are enhanced by color coding that differentiates neighborhoods, helping users see which areas the most expensive listings are located in.

Finally, the Review & Availability Effect dashboard suggests that listings with higher availability throughout the year tend to perform a little better. But frequent Reviews is not that effective. These factors seem to increase listing visibility and possibly lead to more bookings. This indicates a positive relationship between guest engagement, availability, and overall success on the platform.

The third dashboard, titled "Review & Availability Effect," examines how the frequency of reviews and the availability of listings affect their performance. It investigates whether listings with more reviews per month tend to have higher prices or better visibility, and whether availability throughout the year influences a listing's success. By analyzing these factors together, this dashboard aims to uncover whether there is a meaningful relationship between host responsiveness, listing openness, and guest engagement.
